More frequently SumatraPDF users are using tablets or touch screen enabled devices, it is sometimes easy to forget that the right mouse contextual functions are usually available with touch and hold.

Here keyboard shortcuts such as the context menu [▤] are shown between [square brackets] and most of those options are available from the top left ☰ or pull down menus, note this document was generated in WordPad only using 10pt Arial.
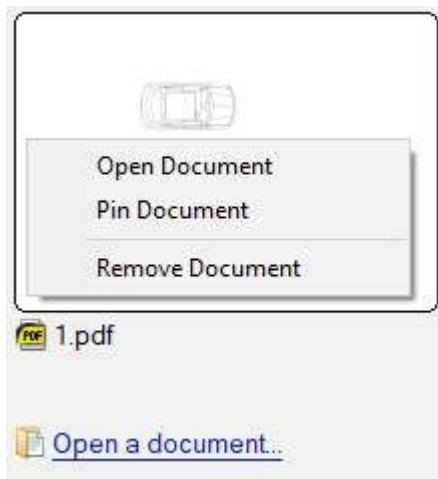

NOTE the Right-Click "in-page" context menus can vary considerably between offering you just one or many functions.

e.g. on the first "Frequently Read" page if favorites is showing [Alt] + [A] + [S] you can Remove an entry with Right-Click
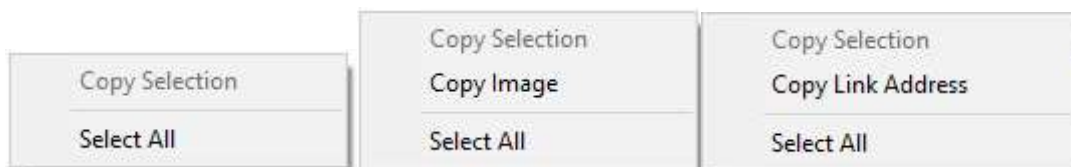

Favorites   ✕

    Remove from favorites

    File Formats (page 1
    Extra Help (page 104

OR ELSE

you need to be over a thumbnail and Right-Click to see

    Open Document
    Pin Document
    Remove Document

📄 1.pdf

📄 Open a document...

- Open Document (same as single click)

- Pin Document (keep this entry as one of the 10 Frequent choices) or Deselect to "Unpin"

- Remove Document (NOTE this only deletes the entry in SumatraPDF-settings.txt + thumbnail in cache & screen)

WITHIN a .PDF the choice is initially limited* to Select All (unless you have selected text or are over an image/hyperlink)

Copy Selection		Copy Selection		Copy Selection
		Copy Image		Copy Link Address
Select All		Select All		Select All

NOTE if the file has DRM set you may not be able to do all of the following (the fallback status is copy text as image)

Copying text was denied (copying as image only)

* the exception is that if you are over a hyperlink you can Right-Click Copy Link Address (even if text copy is denied)
Try Right-Click at end of this line   # For documentation, see http://www.sumatrapdfreader.org/settings3.2.html

IF View > "**Show Pages Continuously**" [on/off] = [C] **is selected**
   THEN Right-Click or [Ctrl] + [A] = Select **All pages**
   ELSE
IF View > "**Show Pages Continuously**" [on/off] = [C] **is NOT selected**
   THEN Right-Click or [Ctrl] + [A] = Select **All of current page**

THEN Right-Click additionally allows you to "Copy Selection" = [Ctrl] + [C]

    Copy Selection
    Select All

NOTE IF the selection is ONLY a scanned page you can paste/insert a **whole page** in MS Paint or WordPad as an image
   IF the selection includes a textual layer you can paste/insert in MS Paint or WordPad ONLY as text (Be aware of DRM)
   IF you have a page with or without text and "floating" images, **double click images to select one at a time**
   ELSE if the page is an image background with/without floating text/images **you may have to do several of above**
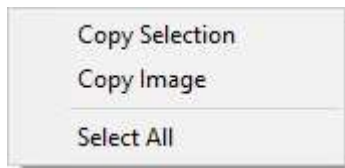

WHEN you click images you have two choices, which MAY affect quality
"Copy Selection" which will respect current zoom level e.g. scale as seen, so best if Zoom=100% OR set it 400/800%
"Copy Image" which stores object in native units and may be enlarged or reduced compared to visible scale at 100%

try Right-Click and Copy Image

See what it looks like when you
paste it in MS Paint

Then with Zoom at 800% try
double click and Copy Selection
Paste again and compare the
results

If you have a two page spread then **Select All** on one page may automatically include the text and images on the other so consider as Select **All Visible**, HOWEVER it depends on the target application what will be pasted.

MS Paint will only accept the first page of those selected as a single Image.
Notepad and other Plain Text editors can only paste the text selected (no images)
Most word processors such as WordPad, Word, Libre Office Writer will offer to do one **or** the other (they cannot get a mix of both images and text from the clipboard). For the simplest way of reversing, RTF editors with more features than WordPad e.g. ArCADia TEXT, can lay the text over the image to allow for formatting then bring the images in front of the text to create a Chimæra PDF. This is the way many PDF to Word document conversions work.

At this point for completeness it is worth pointing out on the FixedPAgeUI there are Right-Click options for inputs to both the Page: and Find: fields

For many users the "Paste" function will be the one frequently used, the R2L & IME functions are mainly for Eastern users.

WITHIN a .DjVu .XPS OR .OXPS

The choices are **similar to PDF** above as the FixedPageUI is default

WITHIN an .ePub OR .Mobi OR .FB2

When EbookUI setting UseFixedPageUI = **true** the choices are **similar to PDF** above
When EbookUI setting UseFixedPageUI = **false** NO context choices are available other than if Favorits (Remove) is seen

WITHIN a Comic Book

The choice is limited by the format to only images so can be All Images, Selected Images or Image at cursor

| |
|---|
| Copy Selection |
| Copy Image |
| Select All |

With Select All it will vary which page is selected as "First" e.g. Left if manga mode is off, Right if manga mode is on.
Quality is affected by zoom state and either Select All / Copy Selection or Copy Image (fixed scale) may be better

With an image flle (GIF TIF JPG TGA PNG)

As per Comic Book i.e. if a multipage file such as Tiff or animGIF then "First" is Left and can be changed by Book / Facing

With a .TeXT format file

These files only open when **EbookUI setting UseFixedPageUI = true** however there are no images so choice is only

Copy Selection
Select All

With a .CHM

When ChmUI setting UseFixedPageUI = **true** the choices are **similar to PDF** above
When ChmUI setting UseFixedPageUI = **false** the interface is **based on internet explorer** and the options are varied to match HTML handling, however note that not all functions are accessible
